## TECHNICAL INFORMATION

## LOW TRENCH UNITS

**23.019**

The conditions below will always remain good, even when their implementation is not explicitly mentioned for a particular case :

#### **I. Estimates and orders**

1. All estimates remain free of obligation and without any agreement on our behalf. An obligation only exists after our written confirmation of the order has been drawn up, even in case of a preceding agreement by telefax or telephone. All other oral agreements are not binding by contract.
2. We reserve ourselves right to all right of ownership and copyright with regard to estimates, drawings and other documents. These shall not be given to third parties.
3. The customer's buying conditions are not binding upon us, even when they are not explicitly rejected by us.

#### **II. Delivery contract**

1. The delivery contract will only be considered to be negotiated after having confirmed the order in writing. This written confirmation of the order also applies to the contents of the contract.
2. Alterations in orders can not be taken into account once the procedure has got started or arrangements have been made with regard to provision of materials.
3. Partial deliveries are allowed.

#### **III. Order on demand**

1. In case of an order on demand, we should be informed a fortnight before the desired delivery date. Only under these circumstances, we can meet the agreed delivery date.
2. Should the orders on demand not be taken partially within the fixed term, we reserve ourselves right to, at the end of this term, send you the goods and charge you for them.

#### **IV. Prices**

1. Unless otherwise agreed, the prices are ex works and not delivered, packing included.
2. Prices hold with the reserve that all costs of material and wages remain unchanged. The legally adopted readjustment of prices at the time of delivery is considered part of the contract.
3. We reserve ourselves right to charge extra for administration expenses, should the invoice not reach a minimum amount.

#### **V. Payment**

1. Payment will be in cash, without reduction within 30 days of the invoice date, free our place of payment.
2. In case of non-payment of the invoice on due date, an interest of delay will be due by right and without proceeding proof of default, amounting to 15% of the invoice amount.
3. In case of non-apymt on due date, the invoice amount will be by right and without proceeding proof of default raised by standard demand for indemnification amounting to 10% of the invoice amount, and this without prejudice to interests and other costs.
4. Withholding payment just like compensations in case of counterclaim not acknowledged by us, are not possible.
5. In case of non-observance of the term of payment just like circumstances only known after the negotiation of a contract and which lead to suspect that the customer will not be able to pay in time, we have the right to be assured that all

engagements resulting of the contract whenever they will be executed, will be observed and to stop the execution of the order until the moment we have this assurance.

lations concerning the conditions of sale an delivery become void, the contract remain unaltered with regard to the validity and all other stipulations and engagements.

#### **MANUFACTURER**

Verco-Versichele N.V.  
Karrewegstraat, 60 B- 9800 Deinze  
Tel +32 -(0)9 / 386 48 46  
Fax +32 -(0)9 / 386 83 63  
E-mail : info@verco.eu  
<http://www.verco.eu>

#### **VI. Terms of delivery and delivery conditions**

1. We are only bound by contract by terms of delivery which have been stipulated by us.
2. Terms of delivery run from the day on which the contract was transacted, however, never before having answered all the questions concerning production.
3. The term of delivery will be observed when the subject of order is entirely ready for delivery.
4. Should unforeseeable circumstances intervene during manufature and other obstacles against our wish occur, like for instance force majeure, we have the right to prolong the agreed term of delivery by the duration of the obstacle plus an appropriate period to resume activities. Should circumstances oblige us, we have the right to be, entirely or partially, released from the obligations of the contract
5. In case of non-payment, we have the right to cease or suspend further deliveries.

#### **VII. Sending and transfer of risk**

1. Damages caused during transportation will be only ensured on demand and at the customer's expense.
2. The safe custody of the goods awaiting delivery or the collection of goods, will be at the buyer's risk.

#### **VIII. Transfer of property**

1. Goods will remain property of the vendor until complete payment of the goods.

#### **IX. Claims and guarantee**

1. Any claim with regard to the delivery must be made within 8 days of receipt of the goods and certainly before application or resale of the goods.
2. We guarantee the delivered goods against any solidly proven faulty material and /or faulty design, which may endanger their application. At choice, we take back the goods at the invoiced price or we replace them free of charge or we have them repaired free of charge in accordance with the original order. We do not take responsibility for consequential damage.  
Any protest against the invoice should be made in writing within 8 days of the invoice date.
3. We do not take responsibility for bearings or parts, which, during the above mentioned guarantee period, wear out in accordance with the duration of their use or which wear owing to pollution or rusting.
4. The jurisdiction for payment and delivery is Ghent, Belgium. All actions under the present contract shall only be brought before the courts at Ghent.
5. Belgian laws goes for all contracts.
6. The contested goods must be kept at our disposal.
7. The right to repairs expires at the latest 3 months after our objection to the goods.
8. The guarantee under section 2 only covers these defaults for a period within one (1) year of delivery.

#### **X. Clause of shortfall**

Should for any possible reason, the above stipu-

B = low trench unit

## **READY TO BUILD-IN DUCT with CONVECTOR**

Large and small building projects frequently entail high demands in respect of interior finish. Every project has its own concept and all the elements must be developed and integrated within this concept. Customization is often required and this also applies for cooling and heating systems. For us customization is not only related to dimensions but also to design, choice of material and finish made to measure.

The trench heaters offer a perfect solution. They comprise a built-in channel with a convector. Variants can be obtained in a forced version (with fan) or be intended for the supply of conditioned air.

As they are built into the finished floor they are perfectly integrated in the interior with a minimum of space loss. A grille finishes off the unit aesthetically and entirely in line with the interior.

Flexibility and customization stand high on Verco's agenda. Finish using window modules, cut-outs around pillars, corners, etc. are perfectly elaborated according to plan.

This design freedom is much appreciated by architects, engineering groups and end-customers. Moreover, the installers also take advantage of the straightforward assembly thanks to the numerous accessories and adjustments

## **OPERATING PRINCIPLE**

By installing low trench units in front of window sections, you avoid cold radiation, cold air flow and window condensation.

### **PROBLEM**

### **SOLUTION**

#### **Cold radiation**

Windows are usually the largest cold sources. This causes cold radiation from the window into the room.

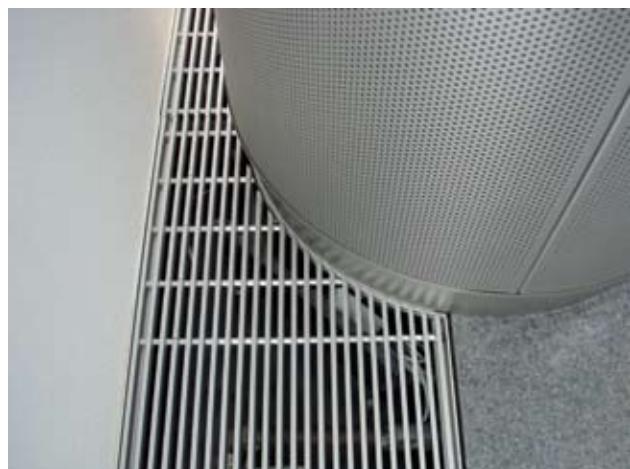

#### **Cold air flow**

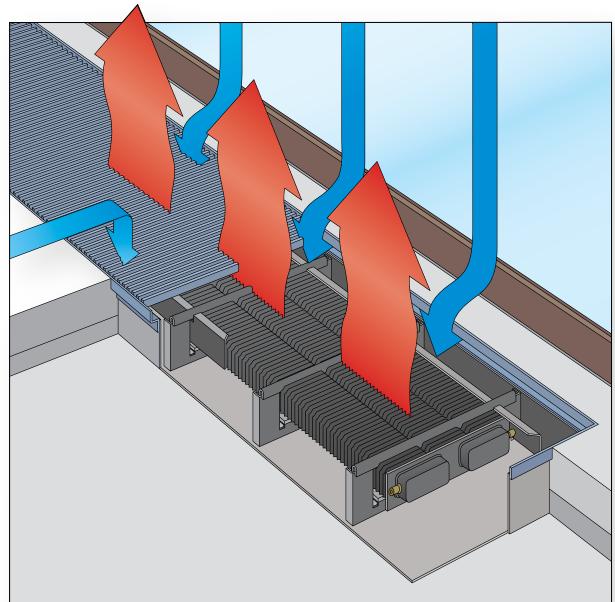

The room air is cooled down near the window section. This cooled air descends and flows into the room via the floor.

#### **Window condensation**

The cold window surface reduces the room temperature. This can cause an increased humidity level. Part of it will cause condensation on the windows depending on the relative air humidity level and temperature of the window surface.

You will prevent these problems by placing convectors on the glass sections (and outside walls). In doing so it is important to make sure the heat (= the convector) extends over the full window length and the heating output of the convector exceeds the heat loss via the window.

## LOW TRENCH UNITS WITH NATURAL CONVECTION

### DESCRIPTION

The low trench unit with natural convection is ideal as an additional heating to supplement floor heating. The broader models can serve as main heating. This system provides an ideal and quick solution in the intermediate seasons when you simply wish to raise the room temperature by a few degrees for a short period of time. They can be combined with low trench unit with fan.

This type comprises a ready to build-in duct and a convector. Their low incorporation height allows them to be built into the floor screed.

### AIR CIRCULATION

See drawing above

By mounting the compact floor convectors in front of glass sections (and cold outer walls) you can prevent the cold air from penetrating into the room.

### MATERIAL

The trench consists of galvanised steel sheet of 1,25 mm lacquered in anthracite grey on the inside and outside. Steel convector supports to strengthen the trench are built into it the trench. The side plates ensure the good conduction of the heated air. Openings are provided in the trench for the passage of the pipes (standard in the right head piece). An anodised aluminium frame is mounted on the trench, the colour of the frame matches that of the grille. If no grille is ordered then a standard 18 mm aluminium natural anodised frame is fitted on the trench (suited for a grille height of 18 mm).

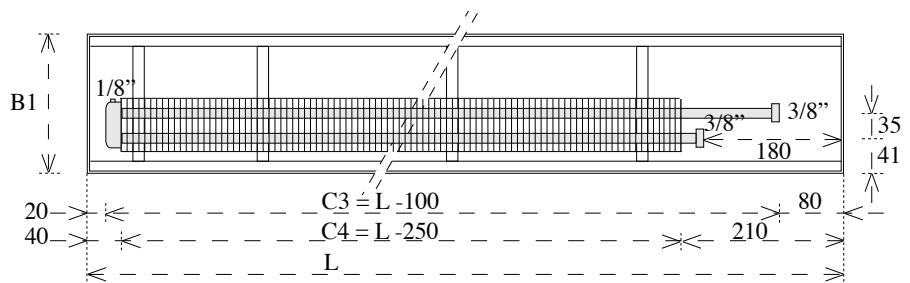

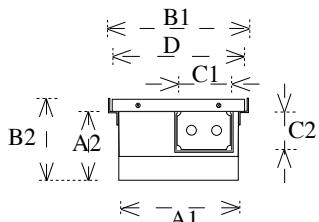

The **convector** is entirely manufactured in steel and is subsequently lacquered in anthracite grey. To prevent contact noises it rests on plastic strips. The trench is longer than the heating element to allow the connections and cocks to be mounted in the trench.

<sup>(1)</sup> Depth low unit trench is 109 mm , with a grille height of 18 mm (standard execution). Depth low unit trench is 111 mm , with a grille height of 20 mm

**STANDARD VERSIONS**

**Frame and grille**

Unless otherwise specified during ordering a natural anodised frame of 18 mm (for a grille height of 18 mm) will be mounted on the trench. If an additional grille is ordered, then the type and colour of the frame will be matched to that of the grille. Grilles in:

- aluminium: can be supplied in natural anodised, brass, bronze and black. The frame colour is identical to that of the grille colour.
- wood: are available in merbau, oak or beech with spacer sleeves in light grey, bronze or black. The frame colour is matched to the colour of the spacer sleeves (resp. natural anodised, bronze or black).
- stainless steel. The standard frame is supplied in black aluminium. If a stainless steel frame is required, this must be specified when ordering.

**Connections**

The standard water connection is on the right of the head side (seen from the room). Upon request the water connection may be supplied positioned on the left of the head side, to the left or right of the room, to the left or right downwards or F+R different ends.

**Accessories**

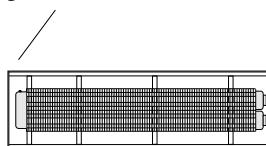

The standard low trench unit comprises: the trench, the convector, the convector supports, the side plates, the division plates and a frame.

**CONTINUOUS TRENCHES**

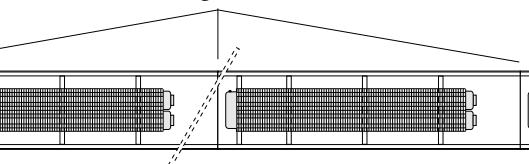

The low trench units are supplied per section of maximum 5.000 mm with a frame section mounted on the head pieces. The different trenches can also be connected to create a continuous optical effect. The head pieces are supplied in the low version without frame. The trenches can easily be fitted to one another by means of bolts.

Obviously, the connection type must be specified.

24	1,67	1,37	1,47	1,33	1,08	1,17	1,02	0,75	0,88	0,73	0,48	0,39	0,29	0,24

## WATER RESISTANCE

The mentioned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 184 mm  
 length trench : 4250 mm  
 heating medium : 75 /65°C  
 air inlet temperature : 20°C  
 Heat output : 749 W

$$\text{water flow} = (749 \times 0,86) / 10 = 64 \text{ kg/h}$$

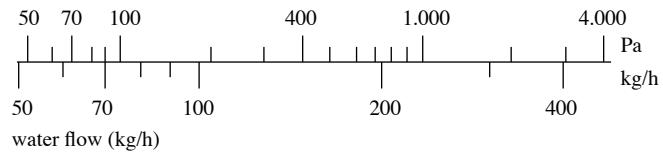

$$\text{connection resistance (graph)} = 81 \text{ Pa}$$

$$\text{convector resistance per meter (graph)} = 41 \text{ Pa}$$

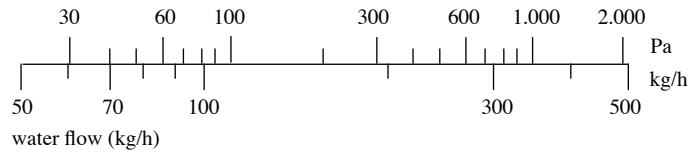

$$\text{total convector resistance} = 4,250 \times 41 = 174 \text{ Pa}$$

$$\text{total water resistance} = 81 + 174 = 255 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## WATER RESISTANCE

The mentioned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench :	259 mm
length trench :	4000 mm
heating medium :	75 / 65°C
air inlet temperature :	20°C
Heat output :	1173 W

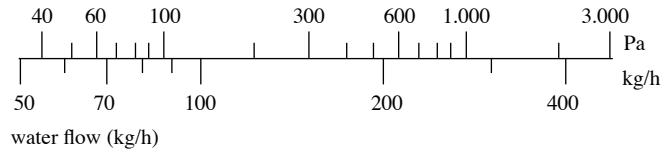

$$\text{water flow} = (1173 \times 0,86) / 10 = 101 \text{ kg/h}$$

$$\text{connection resistance (graph)} = 130 \text{ Pa}$$

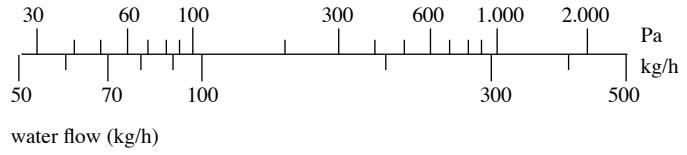

$$\begin{aligned} \text{convector resistance per meter (graph)} &= 22 \text{ Pa} \\ \text{total convector resistance} &= 4,000 \times 22 = 88 \text{ Pa} \end{aligned}$$

$$\text{total water resistance} = 130 + 88 = 218 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## WATER RESISTANCE

The mentioned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 289 mm  
 length trench : 4000 mm  
 heating medium : 75 /65°C  
 air inlet temperature : 20°C  
 Heat output : 1423 W

$$\text{water flow} = (1423 \times 0,86) / 10 = 122 \text{ kg/h}$$

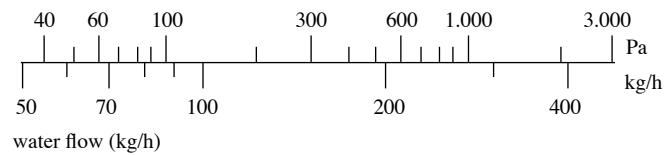

$$\text{connection resistance (graph)} = 280 \text{ Pa}$$

$$\text{convector resistance per meter (graph)} = 44 \text{ Pa}$$

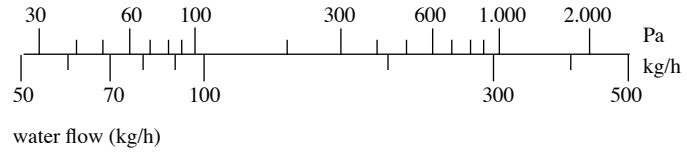

$$\text{total convector resistance} = 4,000 \times 44 = 176 \text{ Pa}$$

$$\text{total water resistance} = 280 + 176 = 456 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## WATER RESISTANCE

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench :	334 mm
length trench :	4500 mm
heating medium :	75 /65°C
air inlet temperature :	20°C
Heat output :	1914 W

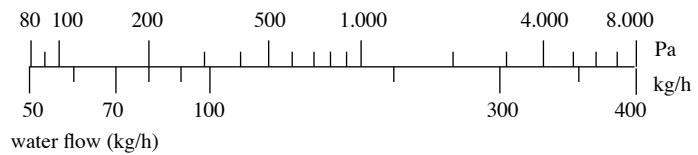

$$\text{water flow} = (1914 \times 0,86) / 10 = 165 \text{ kg/h}$$

$$\text{connection resistance (graph)} = 790 \text{ Pa}$$

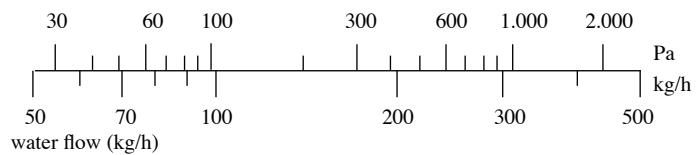

$$\begin{aligned} \text{convector resistance per meter (graph)} &= 275 \text{ Pa} \\ \text{total convector resistance} &= 4,500 \times 275 = 1238 \text{ Pa} \end{aligned}$$

$$\text{total water resistance} = 790 + 1238 = 2028 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## WATER RESISTANCE

The mentioned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 364 mm  
 length trench : 3750 mm  
 heating medium : 75 /65°C  
 air inlet temperature : 20°C  
 Heat output : 1759 W

$$\text{water flow} = (1759 \times 0,86) / 10 = 151 \text{ kg/h}$$

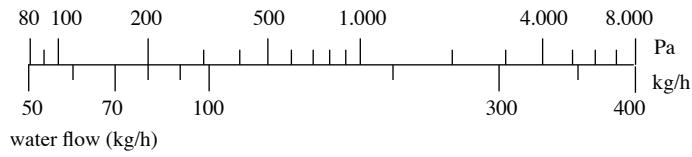

$$\text{connection resistance (graph)} = 690 \text{ Pa}$$

$$\text{convector resistance per meter (graph)} = 230 \text{ Pa}$$

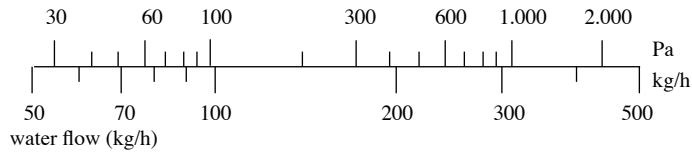

$$\text{total convector resistance} = 3,750 \times 230 = 863 \text{ Pa}$$

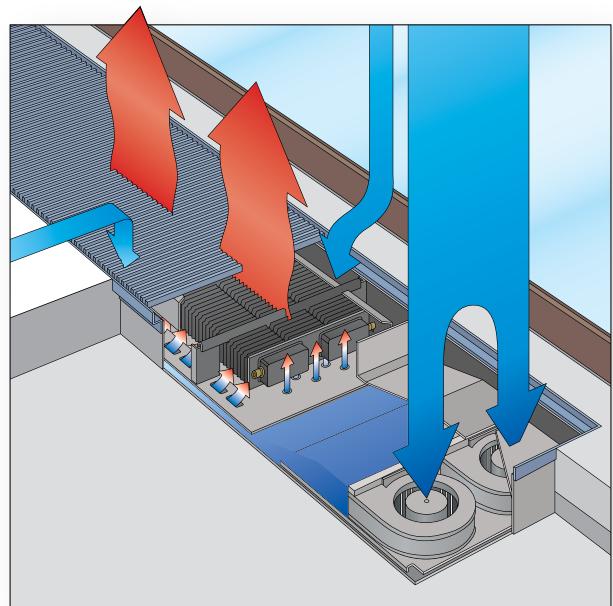

$$\text{total water resistance} = 690 + 863 = 1553 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## LOW TRENCH UNITS WITH RADIAL FAN

### DESCRIPTION

An increased output and quicker heating can be obtained with the trench heater with radial fan. This system has an air conduction channel with inductive outlets at the bottom to ensure a better mix with the ambient air.

The radial fan is a suction radial ventilator, directly driven by a single-phase capacitor motor with external rotor. Connection 230 V, 50 Hz, isolation class B, protection class IP 44. Built-in thermal contact.

This type comprises a ready to build-in duct and a convector. Their low incorporation height allows them to be built into the floor screed.

### AIR CIRCULATION

See drawing above

By mounting the compact floor convectors in front of glass sections (and cold outer walls) you can prevent the cold air from penetrating into the room.

### MATERIAL

The trench consists of galvanised steel sheet of 1,25 mm lacquered in anthracite grey on the inside and outside. Steel convector supports to strengthen the trench are built into it the trench. The side plates ensure the good conduction of the heated air. Openings are provided in the trench for the passage of the pipes (standard in the right head piece). An anodised aluminium frame is mounted on the trench, the colour of the frame matches that of the grille. If no grille is ordered then a standard 18 mm aluminium natural anodised frame is fitted on the trench (suited for a grille height of 18 mm).

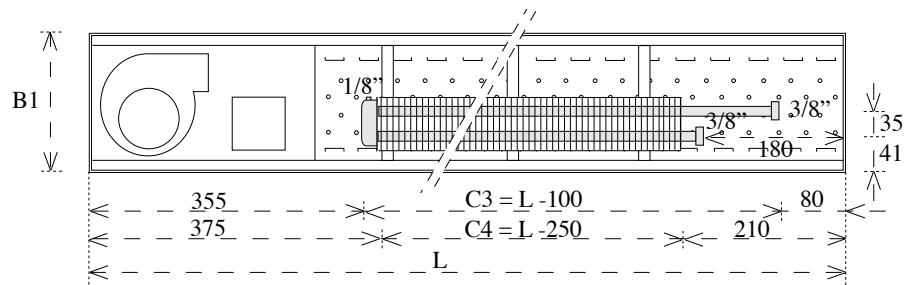

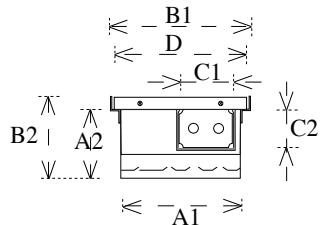

The **convector** is entirely manufactured in steel and is subsequently lacquered in anthracite grey. To prevent contact noises it rests on plastic strips. The trench is longer than the heating element to allow the connections and cocks to be mounted in the trench.

**STANDARD VERSIONS**

**Frame and grille**

Unless otherwise specified during ordering a natural anodised frame of 18 mm (for a grille height of 18 mm) will be mounted on the trench. If an additional grille is ordered, then the type and colour of the frame will be matched to that of the grille. Grilles in:

- aluminium: can be supplied in natural anodised, brass, bronze and black. The frame colour is identical to that of the grille colour.
- wood: are available in merbau, oak or beech with spacer sleeves in light grey, bronze or black. The frame colour is matched to the colour of the spacer sleeves (resp. natural anodised, bronze or black).
- stainless steel. The standard frame is supplied in black aluminium. If a stainless steel frame is required, this must be specified when ordering.

**Connections**

The standard water connection is on the right of the head side (seen from the room). Upon request the water connection may be supplied positioned on the left of the head side, to the left or right of the room, to the left or right downwards or F+R different ends.

**Accessories**

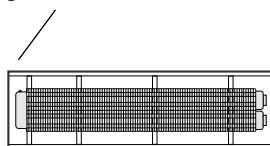

The standard low trench unit comprises: the trench, the convector, the convector supports, the side plates, the division plates and a frame.

**CONTINUOUS TRENCHES**

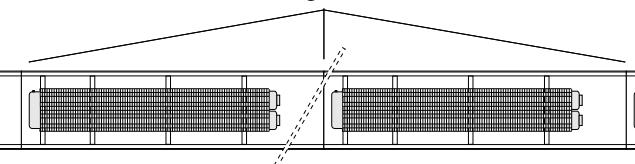

The low trench units are supplied per section of maximum 5.000 mm with a frame section mounted on the head pieces. The different trenches can also be connected to create a continuous optical effect. The head pieces are supplied in the low version without frame. The trenches can easily be fitted to one another by means of bolts.

Obviously, the connection type must be specified.

## WATER RESISTANCE

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 184 mm  
length trench : 3750 mm  
heating medium : 75 / 65°C  
air inlet temperature : 20°C  
Heat output : 1640 W

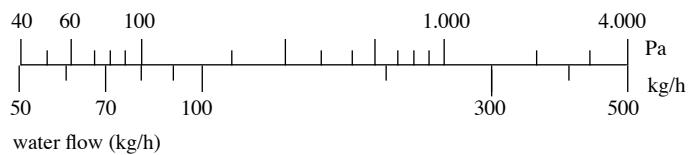

$$\text{water flow} = (1640 \times 0,86) / 10 = 141 \text{ kg/h}$$

$$\text{connection resistance (graph)} = 281 \text{ Pa}$$

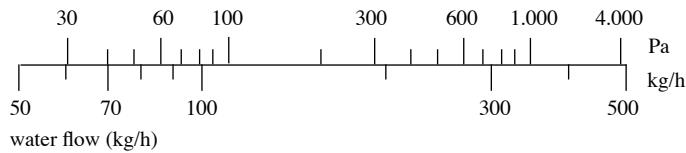

$$\begin{aligned} \text{convector resistance per meter (graph)} &= 126 \text{ Pa} \\ \text{total convector resistance} &= 3,750 \times 126 \\ &= 473 \text{ Pa} \end{aligned}$$

$$\text{total water resistance} = 281 + 473 = 754 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

**LOW TRENCH UNIT : CV.H11**

**WATER RESISTANCE**

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

**example**

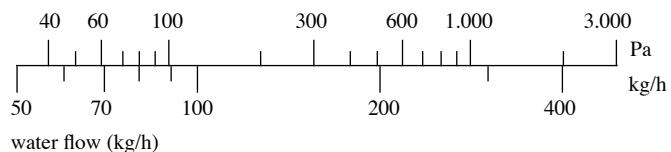

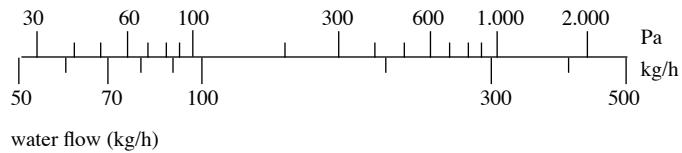

width trench :	259 mm
length trench :	2750 mm
heating medium :	75 /65°C
air inlet temperature :	20°C
Heat output :	2220 W

$$\text{water flow} = (2220 \times 0,86) / 10 = 191 \text{ kg/h}$$

$$\text{connection resistance (graph)} = 460 \text{ Pa}$$

$$\begin{aligned} \text{convector resistance per meter (graph)} &= 74 \text{ Pa} \\ \text{total convector resistance} = 2,750 \times 74 &= 204 \text{ Pa} \end{aligned}$$

$$\text{total water resistance} = 460 + 204 = 664 \text{ Pa}$$

**connection resistance (Pa)****convector resistance per m trench length (Pa)**

**LOW TRENCH UNIT : CV.H11**

TECHNICAL DATA : type B.CV.289.H11

**VERCO****HEAT OUTPUT**

**WATER RESISTANCE**

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

**example**

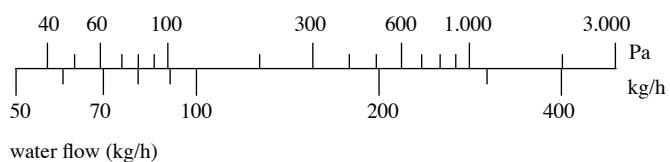

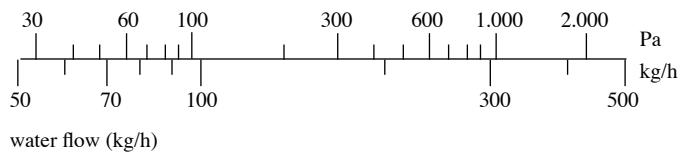

width trench :	289 mm
length trench :	3000 mm
heating medium :	75 /65°C
air inlet temperature :	20°C
Heat output :	2678 W

$$\text{water flow} = (2678 \times 0,86) / 10 = 230 \text{ kg/h}$$

$$\text{connection resistance (graph)} = 720 \text{ Pa}$$

$$\begin{aligned} \text{convector resistance per meter (graph)} &= 131 \text{ Pa} \\ \text{total convector resistance} &= 3,000 \times 131 = 393 \text{ Pa} \end{aligned}$$

$$\text{total water resistance} = 720 + 393 = 1113 \text{ Pa}$$

**connection resistance (Pa)****convector resistance per m trench length (Pa)**

## WATER RESISTANCE

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 334 mm  
length trench : 2500 mm  
heating medium : 75 /65°C  
air inlet temperature : 20°C  
Heat output : 2476 W

$$\text{water flow} = (1476 \times 0,86) / 10 = 213 \text{ kg/h}$$

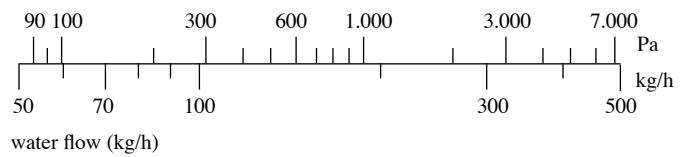

$$\text{connection resistance (graph)} = 1152 \text{ Pa}$$

$$\text{convector resistance per meter (graph)} = 511 \text{ Pa}$$

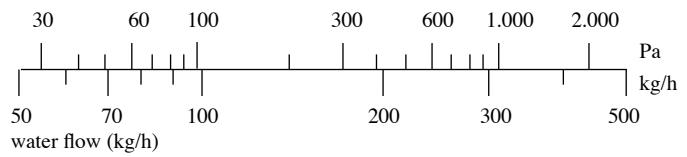

$$\text{total convector resistance} = 3,000 \times 511 = 1278 \text{ Pa}$$

$$\text{total water resistance} = 1152 + 1278 = 2430 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## WATER RESISTANCE

The mentionned values are for an average water temperature of 70°C. With an average water temperature of 50°C, you should multiply with 1,10.

To calculate the total water resistance of the convector, you should add up the resistance per meter trench length with the connection resistance.

### example

width trench : 364 mm  
length trench : 2000 mm  
heating medium : 75 /65°C  
air inlet temperature : 20°C  
Heat output : 2167 W

$$\text{water flow} = (2167 \times 0,86) / 10 = 186 \text{ kg/h}$$

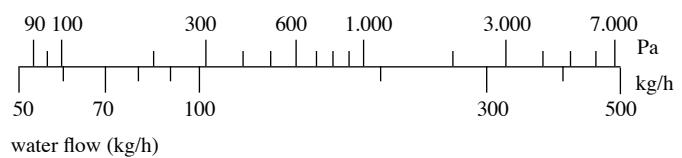

$$\text{connection resistance (graph)} = 916 \text{ Pa}$$

$$\text{convector resistance per meter (graph)} = 326 \text{ Pa}$$

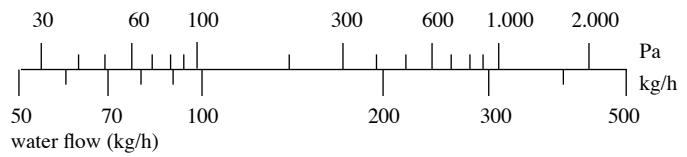

$$\text{total convector resistance} = 2,000 \times 326 = 652 \text{ Pa}$$

$$\text{total water resistance} = 916 + 652 = 1568 \text{ Pa}$$

### connection resistance (Pa)

### convector resistance per m trench length (Pa)

## **LOW TRENCH UNIT : CV.H11**

2007 - TEC0707BK

# **VERCO**

## **TO MENTION WHEN PLACING AN ORDER**

### **DIMENSIONS**

- width
- height
- length

These dimensions are outside dimensions of the trench, incl. frame.

Take enough tolerance.

### **TYP OF LOW TRENCH UNIT**

Check the required heat output..

### **CONNECTION CONVECTORS** (seen from the room)

- head side, right (standard execution)
- head side, left
- room side, right
- room side, left
- to connect different convectors

If necessary, add a drawing

When the valves are not ordered with the trench or are from Verco, take into account that you need sometimes more space into the trench than standard supplied.

### **CONTINUOUS TRENCHES**

The different trenches can also be connected to create a continuous optical effect.

### **GRILLE**

- type of grille
- color of grille

Unless otherwise specified during ordering a natural anodised frame of 18 mm (for a grille height of 18 mm) will be mounted on the trench. If an additional grille is ordered, then the type and colour of the frame will be matched to that of the grille.

### **ACCESSORIES**

- height adjustments : must be ordered at the same time with the trench. Subsequent alterations are not possible.
- valves : When the valves are not ordered with the trench or are from Verco, take into account that you need sometimes more space into the trench than standard supplied.
- thermostats, ...

## **SPECIAL EXECUTIONS**

### **DIMENSIONS**

- width
- height
- length

### **CUT-OUTS**

edges, cut-outs, ...

Make a drawing.

### **OTHER**

- aluminium covering
- lacquered frame and grille
- stainless steel trench with galvanised convector

## VALVES

### THERMOSTATIC VALVE

Build-in dimensions according to DIN 3841 with protection head  
Wired connection for steel or copper.

- DN 10 (3/8") for widths 184  
DN 15 (1/2") 180°, for widths 259, 289, 334 and 364  
DN 15 (1/2") 90°, for widths 259, 289, 334 and 364  
DN 15 (1/2") 90°, returned, for widths 259, 289, 334 and 364

# **LOW TRENCH UNIT**

# **VERCO**

<p><b>B.C.259.H11.***</b></p> 	<p><b>Low trench units with natural convection</b> heat output tested according EN 442, for heating, with natural convection, a ready to build-in trench with convector, existing of following parts: Trench: in galvanised steel sheet of 1,25 mm the inside and outside lacquered in anthracite grey, with convector supports in steel, which also strengthens the trench, with side plates, with openings for the pipings, mounted frame in anodised aluminium, anodised in the same color as the grille. Convector: are completely made out of steel, the fins with double roller collar are secured to the pipes by expansion, lacquered in anthracite grey, working pressure of 10 bar, work temperature of 110°C, lays onto plastic strips to prevent contact noises, length of the convector is adapted to the length of the trench, incl. air vent. trench length (cm) trench height : 109 mm trench width : 184 mm                   259 mm                   289 mm                   334 mm                   364 mm</p>
	<p><b>B.CV.259.H11.***</b></p>  <p><b>Low trench units with radial fan</b> heat output tested according EN 442, for heating, with radial fan (free and dynamical convection), a ready to build-in trench with convector, existing of following parts: Trench: in galvanised steel sheet of 1,25 mm the inside and outside lacquered in anthracite grey, bigger convection thanks to the fan, the fan is in such a way mounted so that over the total length of the trench secondary air is taken in, centrifugal fan with external rotor 230 V / 50 Hz, ready to be connected electrically, mounted on a plate, ventilation through the induction plate, with convector supports in steel, which also strengthens the trench, with side plates, with openings for the pipings, mounted frame in anodised aluminium, anodised in the same color as the grille. Convector: are completely made out of steel, the fins with double roller collar are secured to the pipes by expansion, lacquered in anthracite grey, working pressure of 10 bar, work temperature of 110°C, lays onto plastic strips to prevent contact noises, length of the convector is adapted to the length of the trench, incl. air vent.</p> <p>trench length (cm) trench height : 109 mm trench width : 184 mm                   259 mm                   289 mm                   334 mm                   364 mm</p>
